Introduction

Whether your organization is an airport, hospital, corporate enterprise or warehouse facility, no doubt you are challenged with providing ample, safe, efficient parking facilities for employees and visitors alike.

The good news is that there are practical steps you can take now that will help you to:

- Monitor and track parking availability and traffic speeds 24/7
- Display parking availability notifications in near real-time in parking facilities and adjacent roadways
- Notify parkers and pedestrians about where to park and how much it costs, impending delays, upcoming events and more
- Calm traffic and increase safety in and around your facilities
- Integrate traffic and parking devices
- Leverage data reports and analytics in near-real time for rapid decision making, and as proof of program success

This paper explores these fundamental parking challenges and provides best practice technology-driven solutions you can implement now to overcome your parking dilemmas now and in the future.

We'll also look at two case studies to demonstrate how organizations can benefit from cloud-based IoT* solutions to manage their most challenging parking scenarios.

*Internet of Things

The Situation

There are many factors that contribute to the fact that parking management, notification and safety issues have become even more challenging in recent years.

Parking Expansion—Not Always an Option

With both urban and suburban areas becoming more congested and commercial real estate rates continuing to climb, the need for optimized parking facilities has grown in importance. As organizations expand, they often times find themselves hard-pressed to accommodate the accompanying increased need for parking spaces within the constraints of their existing available square-footage, and even when additional square footage is available, it is often cost-prohibitive to build more parking lots and facilities.

Need for Round-the-Clock Parking Availability, Safety and Data Collection

For airports and hospitals that operate 24/7, shopping malls that have expanded their operational hours to attract more business and logistics centers with day and night shiftwork, parking facilities management, optimization and safety is a round-the clock priority, driving up parking and security personnel costs for organizations.

Parking Availability Not Optimized

The challenges for operations and parking security management are many. First, there's the issue of optimizing existing parking availability so parkers can avoid circling and locate open spaces faster to cut down on lot congestion. Even existing parking "count-based" systems don't account for premium space availability such as expectant mother and handicapped parking. As a result, too much time is spent circling and searching, which can result in traffic congestion blocking exits and spilling out onto the roadway, increased pollution and time lost for activities parkers engage in at the facility (work, shopping, sporting events). Customer satisfaction can be negatively impacted.

Reduced Customer Satisfaction Due to Inadequate Signage

When parking entrances and other areas are not marked with clear directional signage, parkers may become confused as to where they are expected to go—causing delays when they pause to consider their options. During peak parking hours, this can result in lines forming at entrances and gates, and again, reduce customer satisfaction.

Insufficient Safety Due to Speeders

Speeding is always a significant issue for parking security, particularly in places like employee and airport parking, shopping malls during the holiday rush, or at any kind of facility where people are hurrying to arrive at their destination—especially when pedestrians are present. Just as on the open road, motorists are not always cognizant of their travel speed and need to be swiftly reminded before it's too late.

The more crowded the parking area, the more likely the incidence of vehicle and pedestrian accidents. According to the Independent Insurance Agents and Brokers Association, it's estimated that one out of every five motor vehicle accidents take place in a parking lot or facility (that total does not include all the small nicks and dents that usually go unreported), and 14% of all claims of auto damage involve collisions in parking premises. One major reason behind collisions, injuries and fatalities that happen in parking facilities is the mistaken belief that traffic tends to move slower, causing a false sense of security in both drivers and pedestrians. Sadly, hundreds are killed each year in parking lot accidents.

For employers, the inability for staff to locate parking in a timely fashion results in lost productivity (which equates to increased overhead and lost revenue), employee frustration, and issues with municipalities as backups from parking facilities create traffic congestion for residents.

What You Can Do — Adopting a “Smart Cities” Approach to Parking Challenges

Just as municipalities are leveraging technology to solve their most pressing parking challenges, smart organizations can do the same.

By leveraging the right technologies like cloud-based control of devices and data, as well as sensor connectivity, and by utilizing analytics to track important metrics such as peak parking hours, availability, or the number of speeding incidents, and to report on the success of your initiatives with management —you can successfully optimize your parking facilities, increase productivity and keep parkers and pedestrians safer.

Best Practice #1 Manage your parking availability to reduce circling, improve parking space 'findability' and increase safety in your facility.

Most parkers want to find their spots quickly and easily. Whether you're a hospital, a corporate campus, a sports venue or a mall, guiding parkers to the spot they are looking for is critical to customer satisfaction.

It also reduces circling, resulting in a safer, less congested facility and lowering emissions. Your best bet is to track availability and provide notifications to your parkers in the manner most convenient to them at the point that they need it, via message signs, apps or other vehicles.

Best Practice #2 Calm speeders using smart traffic calming techniques to provide a safe facility.

Speeding accounts for over 27% of traffic deaths in the US. The interaction between parkers and pedestrians has the potential for negative outcomes, so ensure that you are doing everything in your power to constrain speeds to a safe level. Understand where and when you have speeding issues and implement best practice traffic calming initiatives to ensure that your pedestrians, as well as other parkers, are provided a safe and secure experience.

Best Practice #3 Leverage onsite messaging to pass along important communications to visitors.

Variable messaging, which provides messages based on input ("Slow down, too fast") or availability information ("14 handicapped spaces available") can help parkers to more quickly and easily get to the parking they need and contribute to the safest environment possible.

Pre-programmed message signs ("Stairway 6 not in use, go → to Stairway 7") can be extremely effective in helping parkers have the best experience. Message signs can also be used for other communications ("Health fair in the cafeteria today").

“

Speeding accounts for over 27% of traffic deaths in the US.

”

Best Practice #4 Automate using the Cloud and conditional messages to manage your parking and safety 24/7.

Conditional messaging is extremely useful in providing important information to parkers even when you're not there, such as current driving conditions (“Ramp to 6th floor parking icy, proceed with caution”) or traffic issues (“Highway 51 experiencing heavy traffic”); and can provide services using pre-set conditional messages, including Time to Destination maps—increasing safety and efficiency for parkers.

Best Practice #5 Leverage data to understand what your true parking needs are.

Understanding when it's time to add capacity can a truly perplexing decision. By understanding your true parking availability, you can anticipate parkers needs better, and have all the information necessary to make better decisions about capacity, pricing and access. Real data, rather than extrapolated, is key as you determine your go-forward plans.

Why “Cloud-based” is Key

Unlike separate systems and devices that operate independently and must be accessed and monitored individually, the right cloud-based parking solution must provide centralization of all your traffic devices, signs, sensors—as well as traffic and parking data, from a single platform with an intuitive interface. In addition, it should integrate with your existing solutions and devices, regardless of manufacturer, ensuring that you can leverage your existing investment.

All Traffic Solutions' patented TrafficCloud™ is an online traffic management solution that lets you manage and communicate parking availability, optimize resource utilization, improve safety and increase customer satisfaction. TrafficCloud gives you immediate access to data, reports and analytics, as well as remote management from any Internet-connected device.

TrafficCloud

INTEGRATED, DATA DRIVEN SOLUTIONS FOR BETTER PARKING OUTCOMES

1

Real time availability to maximize yields and usage.

2

All your data in one secure cloud-based parking solution.

3

Remote access to equipment reduces time—manage all connected devices and dynamic messages from one central location.

4

Open, flexible, scalable architecture that integrates with your existing solutions.

5

Easy-to-use dashboards and reports of all collected data to allow you to make more insightful decisions based on data analytics from all your program components.

CASE STUDY: PARKING SOLUTIONS

Nationwide Children's Hospital

Hospital improves safety in and around high-traffic parking facilities with web-enabled traffic signs.

Ranked as one of America's Best Children's Hospitals by US News and World Report, Nationwide Children's Hospital is a primary pediatric hospital in Columbus, Ohio, with more than 1,280 medical staff members and over 10,000 total employees.

With staff and visitors arriving at the main hospital campus around the clock, often in a hurry, maintaining the safety of parkers is a prime concern for Dan Yaross, Director of Security. Yaross needed an effective way to slow vehicles down as they approached the parking facilities from the hospital's main road. After hearing of Cincinnati Children's Hospital's success with All Traffic Solutions' radar display signs, he knew he had found the solution he was looking for.

Nationwide Children's purchased ATS' Shield12 radar display sign. The sign was first deployed in the staff garage where vehicles often entered and circled traveling over the speed limit, and was programmed to flash when drivers approached at unsafe speeds. The results were very good, says Yaross.

"The flashing lights really grabs people's attention. People hit the garage gate and step on the gas. Once they see those strobe lights flashing they hit the brakes."

The Shield12 worked so well to calm traffic in the staff parking garage that the hospital purchased another ATS sign, this time a portable InstAlert24 variable message display.

"We move the signs around the campus or on the roadway that we own right next to the hospital. You can see people slow down when they see signs. The signs are easy to program and are very intelligent. They have performed well for what we wanted them to do which is to slow people down."

Signs Instruct Parkers Where to Go

In addition to enlisting the signs to calm traffic, Yaross programs the InstAlert24 to display instructions to parkers as they approach the parking facility.

“When entering the two-lane garage, everyone played follow the leader—no one was using the second lane, which caused traffic to back up. We programed the sign to read ‘Please use both lanes’ along with an arrow, and it was very effective.”

Because InstAlert24 is portable, Yaross often deploys it inside the visitors garage as well, to instruct parkers to go straight rather than turn right, which caused back-ups and parking delays. The sign is hung from a ceiling beam so parkers could see it on the entry ramp and respond accordingly.

Using Data to Report on Parking Outcomes

Yaross also likes the ease with which he can access data to run reports. His team used the data recently for a briefing with the hospital's management committee to report on employee unsafe driving. Reports furnished via the TrafficCloud cloud-based traffic management ecosystem enabled the committee to review average traveling speeds, the number of vehicles traveling over the speed limit, and the hours where each garage experienced the greatest and fewest speeders.

By utilizing ATS' Shield12 radar speed display and InstAlert24 variable message sign together with TrafficCloud's robust remote functionality, Nationwide Children's Hospital can more effectively manage its high-traffic parking facilities to improve both garage and road safety, and reduce the time it takes for staff and visitors to park.

CASE STUDY: PARKING SOLUTIONS

Cleveland State University

University directs parkers with portable, web-enabled variable message displays.

Directing parkers at a bustling university can be challenging, especially when you want to relay updated information to parkers as space availability changes. The operations team at Cleveland State University, with an enrollment of over 17,000 students, required a parking notification solution that was flexible—so they could revise message signs quickly and easily.

“Our garages fill up fast, and we needed a way to notify drivers of the latest availability,” said Christmas Mensah, the university’s operations manager of parking.

The solution that the university chose was ATS’ InstAlert24 variable speed message signs (they purchased four), along with the TraffiCloud™ web-based transportation management system. TraffiCloud allows Mensah’s team to change sign messages as needed, and download data and reports.

Currently, there are two signs mounted at the entrances of two main garages, each one programmed to display the current percentage of parking spaces that are full. This allows drivers to decide whether to enter the garage or to drive to another parking location. The signs work so well to inform drivers of current parking conditions that the operations team may mount a third at another garage entrance.

The fourth InstAlert24 variable message sign is transported to various locations around campus including graduations, sporting events and other happenings. The sign is used to notify visitors, students and faculty where to park, and tells them the parking rate for that event. When the sign is moved to another event, they simply reprogram the parking rate to display.

“The signs are very bright and all look fantastic. We can use text, numbers and graphics or arrows for the messages,” Mensah told us.

Parking Availability and Notification Solutions

SCENARIO

A busy commuter college implements a parking availability notification system in two of their campus garages that lets parkers know how many spaces are available in each garage—including handicapped and reserved—updated in near real-time using TraffiCloud and displayed on variable message signs.

They also install time to destination displays that notify parkers of travel times to each major highway, so they can choose the best route home.

RESULTS

1. The parking operations team minimizes the need for parkers to circle the garage in search of parking. There is less road congestion due to backups at garage entrances and exits, reduced emissions, and happier students, staff and visitors.
2. As a result of the Time to Destination displays, major roadways leading from the college are less congested and staff and students are happier with their decision to commute to the campus.

SCENARIO

A Fortune 100 company employs sensor technology in its staff parking lots and garages. These sensors identify parking availability and notify parkers of the number of open spaces (including premium spaces for expectant mothers and the physically challenged) via message displays at each entrance and garage level. The displays update throughout the day in near real-time via remote messages programmed in the user-friendly TraffiCloud interface.

Operations staff runs day and time analysis to share with company management to show capacity statistics by time and day of the week to support inquiry into whether staggered work hours will alleviate parking congestion.

RESULTS

1. Employees can decide whether to enter the garage to park or drive on to the next facility.
2. The company succeeds in facilitating increased productivity: engineers, executives and other highly compensated employees are at their desks ready to work in less time.
3. Less frustration associated with circling for parking among the many parking lots.

SCENARIO

To maximize availability in all its parking areas, a regional airport installs LCD indicators at the end of each aisle of their parking lots that turn green for available parking, red for full.

The sensors can integrate with apps and other systems that notify drivers where available spaces are located; and with mapping software that aggregates sensor data and calculates availability at row, section and facility levels for on-premise display and remote site management.

They install radar speed displays on the roads leading to each garage entrance to calm traffic and increase pedestrian safety in and around parking areas.

RESULTS

1. Backups at each parking area are drastically reduced, and when combined with apps or remote and radial indicators throughout the airport, they alleviate traffic associated with idling trucks and carts at busy cargo and baggage areas.
2. The number of road incidents, fender benders and parking area accidents involving pedestrians decreases significantly, reducing the number of police patrols at the airport.

SCENARIO

Parking security staff at a major hospital utilizes LCD indicators to track availability of parking spaces. Utilizing TraffiCloud maps and charts, they keep tabs on parking availability in near real time—including premium spaces.

Using aggregated historical capacity and availability data in TraffiCloud, the hospital drives proactive planning of the additional parking facility required to support their newly expanded programs.

RESULTS

1. Hospital staff and visitors can locate available regular and premium parking spots faster and more efficiently.
2. With analytical reports in hand, the hospital planning team has the data intelligence necessary to calculate the number of additional parking spaces required based on current occupancy rates.

SCENARIO

A military base requires a fail-proof method to enforce tighter access control by utilizing sensor-driven gate management that counts vehicles as they enter and exit.

RESULTS

1. The base achieves tighter access control, and can proactively notify parkers of restrictions and availability.

Conclusion

By leveraging cloud-based parking solutions and products, your organization can maximize parking availability, keep staff and visitors safe and better informed, and calm traffic in and around parking areas—as well as utilize parking data and analytics for more informed decision making.

ATS Solutions

Parking Availability

- Variable message signs on roads leading to parking facilities direct parkers to open spaces
- Mapping software visually shows availability at row, section and lot levels to inform parkers and parking management
- Historical data on capacity and availability to drive proactive planning
- Multi-color signs at garage entrances to allow facilities to maximize usage and pricing
- Premium parking space management to communicate availability to expectant mothers and those who require handicapped spaces
- Gating management to track vehicles as they enter and exit for tighter access control

Parking Notification

- Near real-time messaging signs provide information on events, weather, traffic delays, etc.
- Remote equipment management from any Internet-connected device
- Conditional messaging based on sensor-driven variables ("Icy Ramps Ahead") or programmed messages ("Don't forget to pre-pay on level 3")
- Integration with mass notification systems can alert parkers to important updates

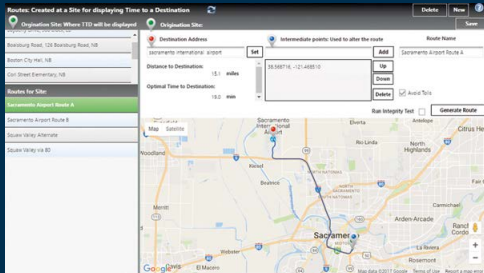

Travel Time Notification

- **Time to Destination:** let parkers choose the best route home, with virtual drive time displays that map and update each route before they even get into their vehicles
- Message board notifications that let parkers choose the best route as they leave your facility

Traffic Calming for Safer Facilities

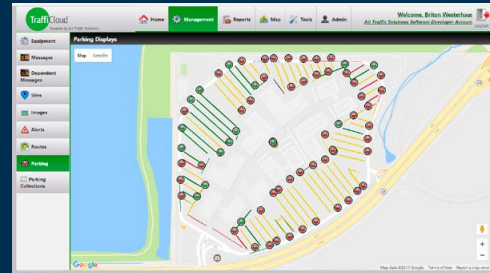

- Leverage data to make safer traffic safety decisions
- Calm traffic in and around parking areas
- Enhance staff, visitor, shopper, student, traveller satisfaction through better safety and smoother parking experience
- Alert parkers to slow down in heavy pedestrian areas
- Report on the impact of your traffic safety program

Products

VIRTUAL DRIVE TIMES

Displays that map and update each route before parkers even get into their vehicles.

MAPPING AND CHARTS

Mapping software visually shows availability at row, section and lot levels for management or parker use.

INDICATOR BOLLARDS

LED indicator bollard that display parking availability with a simple red or green light indicator.

PARKING NOTIFICATION

Guide drivers to available parking with dynamic VMS messages that change as availability changes.

All Traffic Solutions delivers cloud-based traffic management solutions and parking solutions, including radar speed and variable message displays, as well as imaging products and intelligent transportation systems for law enforcement, transportation, smart cities and municipalities.

Our solutions let you optimize resources, and technical support team works with you to maximize the utilization of your equipment. All Traffic Solutions helps you achieve optimal traffic safety outcomes.

- Time-to-destination
- Wrong Way detection
- Smart Work Zones
- Hand Held Lidar
- Data Collection
- Parking Notification
- Virtual Drive Times
- Variable Messaging Systems
- Conditional Messaging
- Counter Classifiers
- Radar Speed Displays

All managed with TraffCloud.
